Growth Plan: 500 Final-Year Registrations in 7 Days

Workshop: Build Your First AI Project in 60 Minutes

Target	Budget	Duration	Candidate
500 registrations	₹2,000	7 days	Vishnu Reddy

Working asset: LaunchLoop live prototype, vishnu-nxtwave.vercel.app | Code: github.com/Vishnureddy0917/Vishnu_nxtwave

1. Understand the Student

Who we are targeting

• Core persona: final-year B.Tech / B.E. students (2027 batch) at Tier-2 and Tier-3 engineering colleges, for example SRM AP, VIT-AP, KL University, Vignan and JNTU-affiliated colleges.

• Branch mix: about 60% CSE / IT / Data Science (primary audience) and 40% ECE / EEE / Mechanical / Civil, the under-served group where growth can come from.

• Mindset: anxious about placements and aware that recruiters skip generic academic projects such as weather apps or library systems. They know AI matters but feel put off by heavy theory and math.

Why they would care

• Instant outcome: build and deploy a working AI project to GitHub in 60 minutes, with no theory.

• Placement value: a concrete, current project to put on the resume before campus drives.

• Low barrier: free, beginner-friendly, no prior ML experience needed.

What makes them register

• Proof of output: seeing the finished project first (for example, an AI Resume Screener).

• Peer influence: seeing batchmates from their own section and branch sign up.

• College rivalry: a live leaderboard that pits their college against rivals.

2. Strategy and Prioritised Channels

Constraint. ₹2,000 cannot buy 500 registrations through ads. At an assumed ₹35–₹50 per click on Meta or Google, the budget yields roughly 40–55 clicks and perhaps 15–20 registrations. Strategy: instead of buying traffic, turn each registered student into a distributor through peer referrals and campus champions.

Phase	Mechanism	Projected registrations
Days 1–2: Seed	10–12 class representatives and club leads post in batch groups across 5 colleges	200
Days 3–5: Referral loop	LaunchLoop gives every registrant a code, a pre-written WhatsApp pitch and a leaderboard (assumed viral coefficient 1.15)	230
Days 6–7: Campus battle and scarcity	Inter-college leaderboard plus a closing-seats push	90
Total		**520**

Prioritised channels (two only)

Channel 1: Class representatives and tech club leads (the seed)

- Action: direct outreach to 10–12 influential CRs and club leads across 5 colleges, giving each a ready-to-forward message and a branded poster.
- Incentive: a ₹200 Amazon voucher for each of the 4 best CRs who deliver 30+ verified sign-ups.
- Why it works: students read batch-group messages, and a recommendation from a trusted CR carries far more weight than an ad.

Channel 2: LaunchLoop referral loop (the multiplier)

- Action: every registrant instantly gets a unique referral code and a personalised WhatsApp message generated by the asset.
- Incentive: the top 5 referrers each win a ₹200 mobile recharge (₹1,000 prize pool).
- Why it works: game mechanics, a reward sized for a student budget, and one-tap sharing inside the app students already use.

Note: the viral coefficient and seed sizes are planning assumptions. Days 1–2 results would be used to re-estimate them and adjust.

3. 7-Day Sprint Calendar

Day	Focus	Actions and milestones	New	Cumulative
1	**Seed launch**	Onboard 10 CRs / club leads across 5 colleges; send seed links to official batch groups.	75	**75**
2	**Campus momentum**	First 100 milestone (“Campus Buzz”). Post the first leaderboard snapshot in groups.	125	**200**
3	**Branch personalisation**	Branch-specific project invites (Edge AI for ECE, predictive maintenance for Mechanical).	85	**285**
4	**Referral race**	Announce top referrers; push 2nd and 3rd place users to rally friends for the ₹200 rewards.	75	**360**
5	**College battle**	Highlight the inter-college gap, for example “VIT-AP is 15 seats behind SRM AP”.	70	**430**
6	**Scarcity push**	“Only 50 seats left” message through groups and WhatsApp status.	50	**480**
7	**Final sprint**	Last seats fill; announce the top 5 winners and send the workshop link.	40	**520**

Daily rhythm

• Morning: check the leaderboard and registration count; pick that day’s shout-out.

• Midday: send the day’s message to ambassadors for forwarding.

• Evening: publish a leaderboard snapshot and thank the day’s top referrers.

4. Funnel Math and Budget

Registration model

Total registrations = seed sign-ups + referral sign-ups + urgency surge

- Seed (days 1–2): 10 colleges × 1 active CR or club lead × 20 registrations per group = 200.
- Referral loop (days 3–5): 200 × 1.15 = 230.
- Campus battle and urgency (days 6–7): 90.
- Projected total: 520, which is 20 above the target as a safety margin.

Budget (₹2,000)

Item	Amount	Rationale
Top 5 referrer rewards	₹1,000	5 winners × ₹200 mobile recharge; fuels the referral loop.
Top 4 CR vouchers	₹800	4 best CRs × ₹200 Amazon voucher for 30+ verified sign-ups.
Contingency	₹200	Testing costs and tie-breaker reward.
Total	**₹2,000**	Cost per registration: ₹3.85 (₹2,000 / 520)

Risks and mitigations

- Referral rate lower than 1.15: each 0.1 drop costs about 20 registrations; mitigated by recruiting more CRs on day 2 and extending the leaderboard push.
- Fake or duplicate sign-ups: the production design allows one registration per verified phone number, and rewards are paid only on verified entries.
- CR drop-off: keep 2 reserve CRs per college and share daily recognition.

5. The Working Asset: LaunchLoop

LaunchLoop is a referral engine and leaderboard that turns every registration into a distribution channel.

Link	URL
Live demo	https://vishnu-nxtwave.vercel.app
Repository	https://github.com/Vishnureddy0917/Vishnu_nxtwave

What was built

- Lead capture: full name, 10-digit Indian mobile validation and branch.
- Pitch matcher: project suggestions and WhatsApp copy tailored to the student's branch (CSE, ECE, Mechanical, Civil) in four tones: Placement, FOMO, Friendly and Zero-Code.
- One-tap sharing: WhatsApp deep link with the referral code pre-filled, tracked through the URL hash.
- Gamification: live progress bar with milestones, top 5 referrers board and inter-college battle.
- Demo mode: a button that simulates a referral so the counting logic can be tested in seconds.

Architecture

Layer	Technology	Role
Prototype	Single-file HTML and JavaScript, browser storage	Demonstrates the full flow with no setup.
Frontend (production)	React.js on Vercel	Registration, dashboard, leaderboards.
Backend (production)	Node.js and Express on Render	Register, referral credit and leaderboard APIs.
Database (production)	NoSQL database	Users with a unique index on phone and referral code.

Note: the prototype stores data in the browser; the Express backend with a NoSQL database is the planned production path.
